

B1  
C  
5 determining an availability of the called wireless communication terminal equipment [being determined] by said appertaining base station in the home area in response to said switching of calls; and rerouting the call, given non-availability of the called wireless communication terminal equipment, to the sub-communication network using the appertaining base station.

---

10. (Twice amended) A method for controlling calls in a communication network, comprising the sequential steps of:

B2  
10 calling, using a telephone number, wireless communication terminal equipment wirelessly connected to base stations of a home area, the base stations being connected to communication terminals of the communication network, and the wireless communication terminal equipment being additionally wirelessly connected to a sub-communication network of the communication network;

15 switching calls directed to a called wireless communication terminal equipment to an appertaining base station in the home area using the communication network; [,]

20 determining an availability of the called wireless communication terminal equipment [being determined] by said appertaining base station in the home area in response to said switching of calls;

rerouting the call, given non-availability of the called wireless communication terminal equipment, to the sub-communication network using the appertaining base station; and

25 initiating a call setup for a rerouted call in the sub-communication network using a mobile telephone number of the called wireless communication terminal equipment, the rerouted call being initiated for the respective wireless communication terminal equipment.
